

Real Estate Market & Transaction Analysis - Business Problem Statement

Business Problem

Real estate stakeholders need reliable insights into property pricing, housing demand, buyer behavior, affordability, and investment activity. Market conditions vary across cities and over time, making it difficult to identify profitable opportunities and make informed decisions without data-driven analysis.

Project Objective

Analyze real estate transaction and market data using SQL to uncover trends in pricing, demand, supply, buyer activity, and investment patterns. The goal is to generate actionable insights that support strategic decision-making.

Key Business Questions

- How do property prices vary across cities and over time?
- Which regions have the strongest housing demand?
- Which property types are most valuable and most frequently listed?
- How do interest rate changes affect property prices?
- Which cities experience the most new construction activity?
- Which buyer segments are most active?
- Which income groups face affordability challenges?
- Which cities attract the highest investor activity?

Expected Business Impact

- Improve investment decision-making.
- Identify high-growth regions and opportunities.
- Support pricing and valuation strategies.
- Understand buyer preferences and affordability constraints.
- Enable proactive, data-driven real estate planning.
